Customize and Download Installer

Enter server information

All forms fields are optional. The more data that you provide, the more customized your installer will be. If you pass no data you either have to pass it on the command line or edit the config of the target [server afterwards

**Or you can run a CLI set-up instead, see: [link to doc](#).*

Server Name Server Path Managed Server Name Target Location  Enable agent at server restart.

[Download Installer](#)

Steps to take after downloading

Place the file in a target directory

The default location is the current working directory, unless you specified a directory in previous steps. Note: Storing the installer in the same directory as your server instance, will simplify the command line needed to run the installer (as you won't need to provide a `-targetlocation` -).

Run the installer

In a CLI tool, run `'java jar hawkularwildfly-agent-installer.jar -encryptionkey <your key here>'`
For detailed installation instructions, refer to [link to docs](#).
