**Subject:** Re: Test connection issues in management console

After talking to Josephine we agreed that it's better to remove the test connection button from the wizard. Instead we'll add a description / summary on the last page which explains where the user can test the connection. We'll also add a "Test connection" option in the dropdown menu of a selected datasource (next to "View" and "Remove").

For the long term I really would like to have the test connection feature in the wizard again. But this requires modified / new management operations and

is something for WF 11 / EAP 7.1.

@Bilge

Are there any objections from your side removing the test connection from the wizard?

No objections. Thank you all for looking into this.

>> Moreover I suggest to delete datasource created by test connection button if user close wizard by clicking 'Cancel' button even though it will mean the server will remain in reload required state.

>

> For me that's a half-baked solution. What if the test connection fails? As a user I'd like to go back and verify the settings - maybe changing a typo in the username / password fields or fix some other attributes. IMO having no option to go back creates more frustration than not having the test connection button at all.

>

> So I recommend to remove this feature from the wizard. We need to think about a way to address this on the server side by having a dedicated management operation. But that's something for WF 11 / EAP 7.1
